

Subjects and Algorithms Summaries

Limitss

Existance

Limit exists \iff left-hand and right-hand limits exists and $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$.

Functions

Monotonic Functions

If function f is increasing ($f'(x) > 0$) or decreasing ($f'(x) < 0$) for an interval $\implies f$ is Monotonic function.

Solving Inverse of a Functions

1) Solve $y = f(x)$ for x

$$x = f^{-1}(y)$$

2) Interchange x and y to obtain

$$y = f^{-1}(x)$$

Continuity

$f(x)$ is continous \iff followings holds:

$$1) \exists f(c) \quad (c \in D(f))$$

$$2) \exists \lim_{x \rightarrow c} f(x)$$

$$3) \lim_{x \rightarrow c} f(x) = f(c)$$

(Function is continous \iff there exists $f(c)$ and limit exists at c and limit of $f(x)$ at when $x \rightarrow c$ is equalt to $f(c)$).

One-variable Calculus

Vertical Asymptote

If

$$\lim_{x \rightarrow a^+} f(x) = \pm\infty \quad \vee \quad \lim_{x \rightarrow a^-} f(x) = \pm\infty$$

a is vertical asymptote.

Horizontal Asymptote

If

$$\lim_{x \rightarrow \infty} f(x) = b \quad \vee \quad \lim_{x \rightarrow -\infty} f(x) = b$$

b is horizontal asymptote.

Oblique or Slant Asymptote

An oblique or a slant asymptote is an asymptote that is neither vertical or horizontal.

If the degree of the numerator is one more than the degree of the denominator, then the graph of the rational function will have a slant asymptote. Slant asymptote find by long division of the rational function. When denominator's degree is equal to one, numerator is the asymptote function.

!* A graph can have both a vertical and a slant asymptote, but it CANNOT have both a horizontal and slant asymptote.

L'Hospital's Rule

!This rule is can be used in only one-variable calculus

If $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{0}{0} \vee \frac{\infty}{\infty}$, take derivatives of numerator and denominator separately ($\frac{f'(x)}{g'(x)}$) until it is $\neq \frac{0}{0}$ or $\frac{\infty}{\infty}$

Sandwich Theorem

Suppose $g(x) \leq f(x) \leq h(x)$ and $\lim_{x \rightarrow c} g(x) = \lim_{x \rightarrow c} h(x) = L$. Then,

$$\lim_{x \rightarrow c} f(x) = L$$

Tangent Line to the Curve

Let $y = f(x)$ at (x_0, y_0)

1. Calculate slope m : $m = \lim_{h \rightarrow 0} \frac{f(x_0+h) - f(x_0)}{h} = f'(x_0)$

2. If limit exists, find tangent line: $y = y_0 + m(x - x_0)$

Instantaneous Speed

$$\lim_{\Delta t \rightarrow 0} \frac{\Delta s}{\Delta t} = f'(x_0)$$

Graphing steps for $y=f(x)$

1. Identify domain of f and symmetries (even/odd)(horizontal/vertical/slant)
2. Find y', y''
3. Find critical points(bounds, $f'(x) = 0$, $\nexists f'(x)$) as (x,y) .
4. Find intervals of f that it is increasing ($f'(x) > 0$) or decreasing ($f'(x) < 0$)
5. Find local max and minimums (critical points that change signs $f'(x)$).
6. Calculate all critical points and find absolute min and absolute max.
7. Find points of inflection ($f''(x) = 0$) and concavity ($f'' < 0$ and $f'' > 0$)
8. Plot key points, intersections then concavities.

Shifting and Stretching Graph

Let $y = af(b(x + c)) + d$.

a: (+) \rightarrow horizontal stretch or compression, (-) \rightarrow reflection about y-axis

b: (+) \rightarrow vertical stretch or compression, (-) \rightarrow reflection about x-axis

c: horizontal Shifting

d: vertical shift

Rolle's Theorem

Let $f(x) = y$ is continuous at every point of $[a,b]$ and differentiable at every point of (a,b) .
Then, if $f(a) = f(b)$ then $\exists c$ that $f'(c) = 0$.

Mean-Value Theorem

Mean-Value theorem use Rolle's Theorem to get this equation:

$$\frac{f(b) - f(a)}{b - a} = f'(c)$$

Integral

Integration by Parts

$$\int (f(x)g'(x))dx = f(x)g(x) - \int (f'(x)g(x))dx$$

Let $u = f(x)$ and $v = g(x)$. Then the statement will be

$$\int (u)dv = uv - \int (v)du$$

*Priority of picking u is shortened by LIATE (L-Logarithms, I-Inverse Trigonometric, A-Algebraic, T-Trigonometric, E-Exponential)

Taking Integral of Powers of Cosinus and Sinus

Let $\int (\sin^m(x) \cdot \cos^n(x))dx$.

1. If m-odd \rightarrow replace $\sin^2(x)$ with $\sin^2(x) = 1 - \cos^2(x)$
2. If m-even and n-odd \rightarrow replace $\cos^2(x)$ with $\cos^2(x) = 1 - \sin^2(x)$
3. If m-even and n-even \rightarrow replace $\sin^2(x)$ with $\sin^2(x) = \frac{1 - \cos(2x)}{2}$ and $\cos^2(x) = \frac{1 + \cos(2x)}{2}$

Vector Calculus

Area of Parallelogram

$$||u \times v|| = |u||v|\sin(\theta)$$

Volume of Parallelepiped (Triple Scalar Product)

$$(u \times v) \cdot w = \begin{vmatrix} u_1 & v_1 & w_1 \\ u_2 & v_2 & w_2 \\ u_3 & v_3 & w_3 \end{vmatrix}$$

Vector Equation for line

r_0 is initial point, t is parameter (scalar), v is direction vector (usually unit vector)

$$r(t) = r_0 + tv$$

Distance from a Point to a line

$$\frac{|\overrightarrow{PQ} \times \vec{n}|}{\|\vec{n}\|} = distance$$

Plane Equation

Normal Vector to a plane: $n = Ai + Bj + Ck$

$$\text{Plane} = n \cdot \overrightarrow{P_0P}$$

$$= A(x - x_0) + B(y - y_0) + C(z - z_0) = D$$

So, the final equation for plane is:

$$A(x - x_0) + B(y - y_0) + C(z - z_0) - D = 0$$

Line of Intersection of Two Planes

Let planes P_1 and P_2 are $P_1 = A_1x + B_1y + C_1z = D_1$ and $P_2 = A_2x + B_2y + C_2z = D_2$

1. Find an intersection point (P_0) of two planes: $P_1 = P_2$
2. Find direction vector (\vec{u}) of intersection line

$$\vec{u} = \vec{n}_1 \times \vec{n}_2 = \begin{vmatrix} i & j & k \\ A_1 & B_1 & C_1 \\ A_2 & B_2 & C_2 \end{vmatrix}$$

3. Write new plane equation as follows:

$$A_3(x - x_0) + B_3(y - y_0) + C_3(z - z_0) - D = 0$$

Distance from a Point to a Plane

$$\frac{|\vec{PQ} \cdot \vec{n}|}{\|\vec{n}\|} = distance$$
